1. Background and Objectives

This is the second half of the methods sequence, where the focus shifts to methods for categorical and survival data.

Topics in Categorical include contingency tables and associated tests (excluding those covered in Methods I), generalized linear models for contingency tables, logistic regression, Poisson regression, nominal and ordinal response models, conditional logistic regression.

Topics in Survival analysis include survival distributions, hazard distributions, censoring mechanisms, and truncation mechanisms. Topics also include parametric and nonparametric methods for estimation and inference, including the Kaplan-Meier estimator, exponential and Weibull models, log-rank tests, the generalized Wilcoxon test, the Cox proportional hazards regression and extensions to time-dependent covariates.

2. General Information

Course Directors: Sharon Xie (sxie@pennmedicine.upenn.edu) Warren Bilker (warren@pennmedicine.upenn.edu)

Teaching Assistant: Emily Getzen (getzene@pennmedicine.upenn.edu)

Format: Lecture: Monday and Wednesday from 10:15 am - 11:45 am

Class Location: Online until January 24 and then in person starting January 24 (Blockley 701)

Office Hours: Categorical: Dr. Bilker - Wednesday 1:30-2:30, Emily Getzen – Thursday 3-4
              Survival: Dr. Xie – Wednesday 1:30-2:30, Emily Getzen – Thursday 3-4

Credits: 1 course unit

Prerequisites: Linear algebra, multivariable calculus, BSTA 630 (Biostatistics Methods I), BSTA 620 (Probability), BSTA 621 (Statistical Inference), BSTA 651 (Introduction to Linear Models and Generalized Linear Models) (these courses may be taken concurrently).

Textbooks: An Introduction to Categorical Data Analysis – 3rd Edition, by Alan Agresti
