Purpose This scale [1] measures the subjective level of sleepiness at a particular time during the day. On this scale subjects indicate which level best reflects the psycho-physical state experienced in the last 10 min. The KSS is a measure of situational sleepiness. It is sensitive to fluctuations.

Population for Testing It has been used in studies of shift work, jetlag, for driving abilities [2], attention and performance, and in clinical settings. It is used for both males and females.

It is helpful in assessing the changes in response to environmental factors, circadian rhythm, and effects of drugs. Because the KSS is not a measure of ‘Trait’ sleepiness, it has not been widely used for clinical purposes.

Administration This is a self-report measure. It takes 5 min to complete.

Reliability and Validity In a study conducted by Kaida et al. [3], the authors investigated the validity of the KSS and found that it was highly correlated to EEG and behavioral variables. The results show that KSS has a high validity. However, because the scores of the KSS vary according to earlier sleep, time of day, and other parameters, it is difficult to deduce its test–retest reliability.

Scoring This is a 9-point scale (1 = extremely alert, 3 = alert, 5 = neither alert nor sleepy, 7 = sleepy – but no difficulty remaining awake, and 9 = extremely sleepy – fighting sleep). There is a modified KSS that contains one other item: 10 = extremely sleepy, falls asleep all the time. Scores on the KSS increase with longer periods of wakefulness and it strongly correlate with the time of the day.

Karolinska Sleepiness Scale (KSS)

- Extremely alert: 1
- Very alert: 2
- Alert: 3
- Rather alert: 4
- Neither alert nor sleepy: 5
- Some signs of sleepiness: 6
- Sleepy, but no effort to keep awake: 7
- Sleepy, but some effort to keep awake: 8
- Very sleepy, great effort to keep awake, fighting sleep: 9
- Extremely sleepy, can’t keep awake: 10
