

Note: A woman who has confirmed *COVID-positive testing* in the past does not require repeat testing on presentation for delivery. She will be treated as a *COVID-positive patient* until she meets the following milestones:

- Afebrile x 72 hours without taking antipyretic medications *and*
- Onset of symptoms >14 days prior *and*
- Resolution (or near resolution) of pulmonary symptoms (knowing some cough may persist)

When these milestones are met, the woman will be treated as a *COVID-negative patient*.

If the mother was tested previously before her admission and received a negative test, and it has been greater than 24 hours, we can test again upon admissions. If she receives her second negative test she can be treated as negative.

If the newborn ultimately requires admission to the ICN due to prematurity or illness, the woman will also need to have negative testing twice, at least 24 hours apart, to meet the requirements for entry to the ICN. The newborn will be treated as a PUI until tested at 48 hours of birth and receives one negative test.

For all PUI births (asymptomatic or symptomatic) we will take the baby for an immediate bath.

Remember that partners who are active PUI cannot enter the ICN. Partners with documented COVID-19 will need negative testing x2 to enter the ICN.
